Assignment 6A — Low-Fi

Shopping Cart Low-Fidel Sketch:

My low-fi sketch of the shopping cart is very different to the one I originally implemented. I originally had a pop-up cart that showed up on the side of the screen when the user added an item to their cart. However, I realized the elements of the item added (personalized glazing and quantity) was very hard to read. Since I wanted users to quickly edit a product in their shopping carts, I recognized the importance of designing those elements to be clear and easy to click. This sketch represents the different ways users can interact with the shopping cart. I didn't want to overwhelm users with too much information, so I added a separate box to summarize the users' shopping cart (subtotal, having a separate checkout process, having a button for users to go back to the order page).
